

KIPSUM – PITCH DECK

1 – The Problem

—

Context

Decrease in primary resources

Uncontrolled energy consumption

No reduction in CO2 emissions and increased global warming

We are at the convergence between technology and the 2015 Paris Agreements

Statistics on the market

20%

CO2 linked to comfort in building

30%

CO2 linked to industrial activity

0%

No or few improvement since years

3-4°C

Global warming if nothing is done

Introduction

Kipsum has designed an intelligent and connected energy manager that minimizes consumption through artificial intelligence

Markets: smart building, smart city, smart transportation

Paris/France

5

Creation

AI for All systems

Data management

Monitoring Based OPTimum Control

DS OUTSCALE

MADE IN FRANCE

Optimum control (MBOPC) : what does it means

MBOPC

Learning methods, Parameters identification through IOT

$$\dot{E}_{int} = \dot{Q}_{struct,int} + \dot{Q}_{infiltration} + \dot{Q}_{window} + \dot{Q}_{int,solar} + \dot{Q}_{occupant} + \dot{Q}_{HVAC} + \dot{Q}_{ventilation}$$

$$\dot{Q}_{window} = \delta_{window} K_{window} (T_{ext} - T_{int})$$

$$\delta_{window} = \begin{cases} 1 & \text{if window is open} \\ 0 & \text{if window is closed} \end{cases}$$

Optimum control (MBOPC) : what does it means

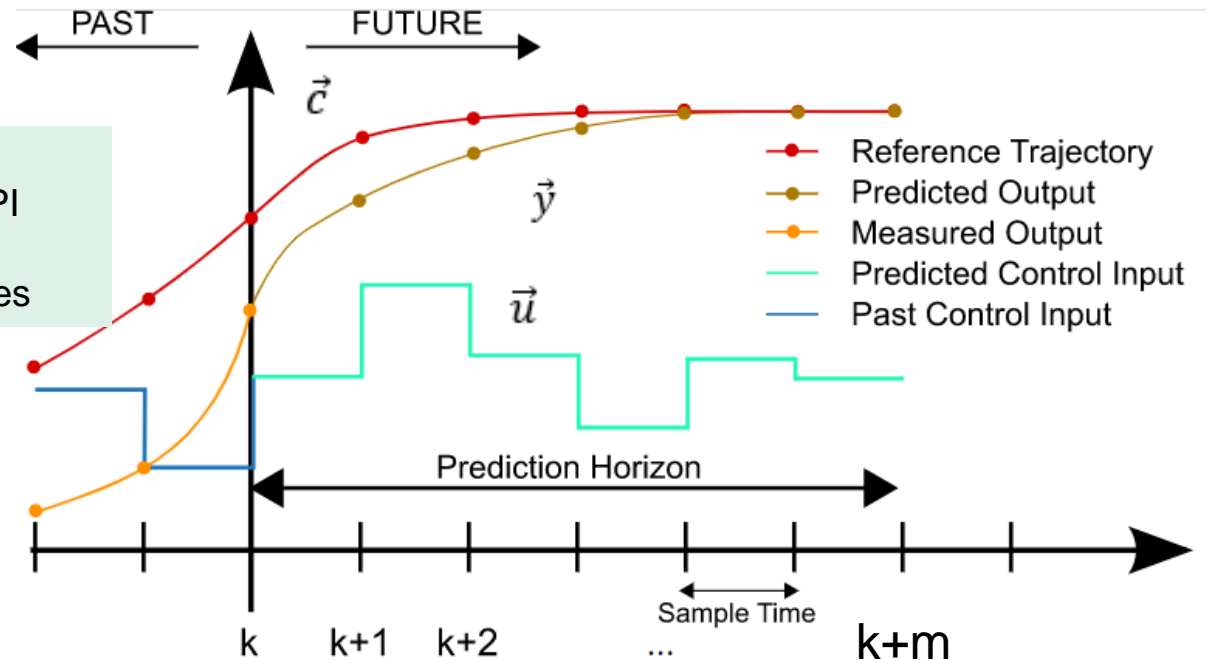

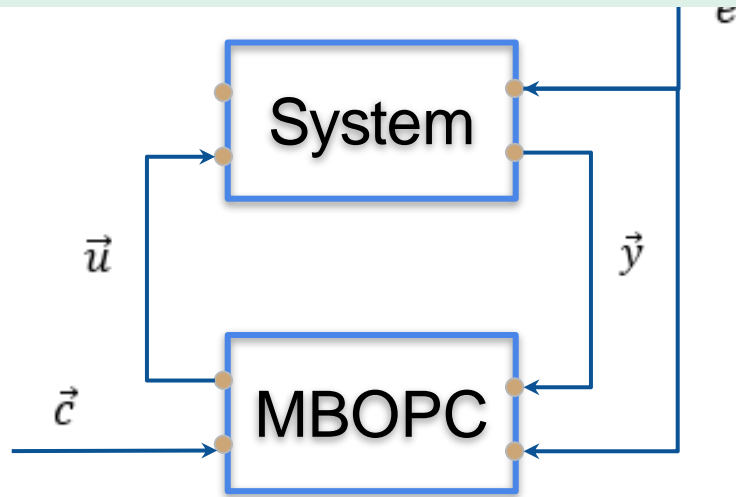

MBOPC

Optimum control through API in real time

Principle:

Transmitted as a curve or as a CSV / Excel file through API

Influence on the water laws, or the launch of comfort modes

The challenge is to find m control vector u which will minimize the objective function J over a horizon where the command will change m times

$$J = \sum_{j=1}^m \left[\sum_{i=1}^n \left[\alpha_i (T_{int,i} - T_{sp,i})^2 + \beta_i ([CO_2]_{int,i} - [CO_2]_{sp,i})^2 + \gamma_i \dot{W}^2 \right] \right]$$

The team

Rami Abou-Eid (PhD)
CEO Co-Founder
40% share
10 ans Alstom

Philippe Chevalier
General Manager Co founder
40% share
16 years PSA, Alstom

Bruno Vallet (PhD)
CTO-Co founder

2 – Implementation of the solution

—

Solution

Advanced Solution

- Already 15 active customers
- Renault, Dalkia, Daher trust us

Innovative

- Patented solution
- Unique digital twin on the market

Key success factor

- Follow market growth
- Be responsive and customized

Smart building and factory Solution in SAAS mode

Standard

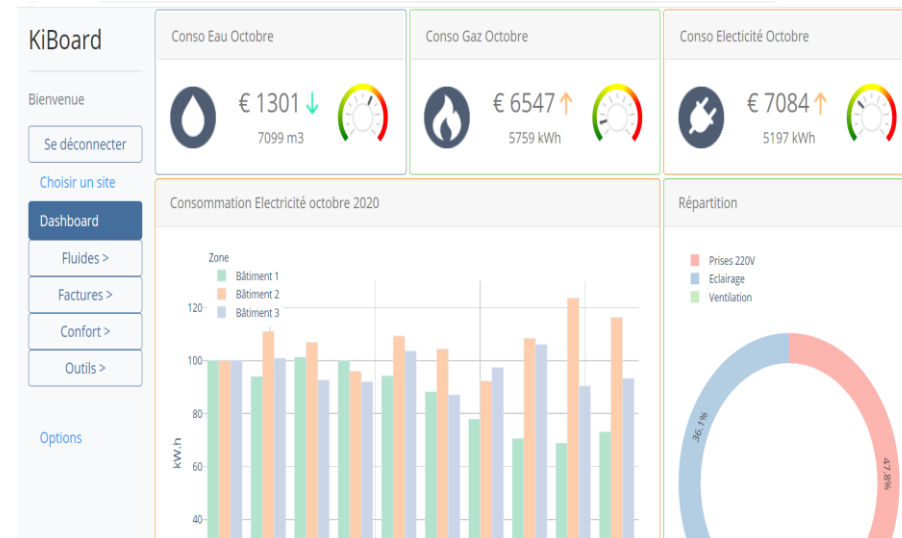

API Implementation with customer

Digital twin creation

Predictive command achievement

Performance follow up

Intrumented building

Premium

Standard

+ Instalation of Kipsum associated sensors

+ Implémentation of associated interfaces

+ dedicated dashboard and follow up associated

All buildings

Smart Lighting with our kilight smart transformer

Standard

smart transformer
installation

Creation of the digital
twin

Optimum command or
design recommendation

Predictive maintenance
performance monitoring

Tout éclairage

- Partner installer
- LoRa or GSM mesh of all lighting
- Savings of up to 70% on your bills. ROI - 3 years old. IP 65 enclosure
- Robust connected voltage regulator compatible with all cameras

A strategic differential on predictive maintenance

□ Head-end measurements, source separation algorithms:

- Evaluation of yields and their evolutions (degradations).

□ So-called "health" indicators for modeling the aging of equipment and the building envelope.

□ a maintenance plan based on availability, maintainability / costs / availability criteria

□ Algorithms build the indicators: minimum input data / advanced modeling techniques coupling physics and machine learning methods (AI and optimization).

□ Predictive maintenance makes it possible to follow, detect and predict the evolution:

- Energy yields of machines (pumps, compressors, fans, filters, etc.)
- Thermo-physical characteristics of the constituent elements of the building envelope (openings, infiltrations, walls, etc.)
- Characteristics and health of distribution units (ducts, pipes, radiators, etc.)
- In occupant behavior (excessive locker, opening windows, control of eco mode during absences, etc.)
