

*Explore with purpose*

*End plastic pollution*

*Regenerate nature*

**NOMAD  
PLASTIC**

*Nomad Community - Nomad Energy - Nomad Archipelago*

United by the same **passion for the Ocean**

**Exploring its treasures** makes us feel alive

**We grew stronger by visiting some  
of the **most remote places on Earth****

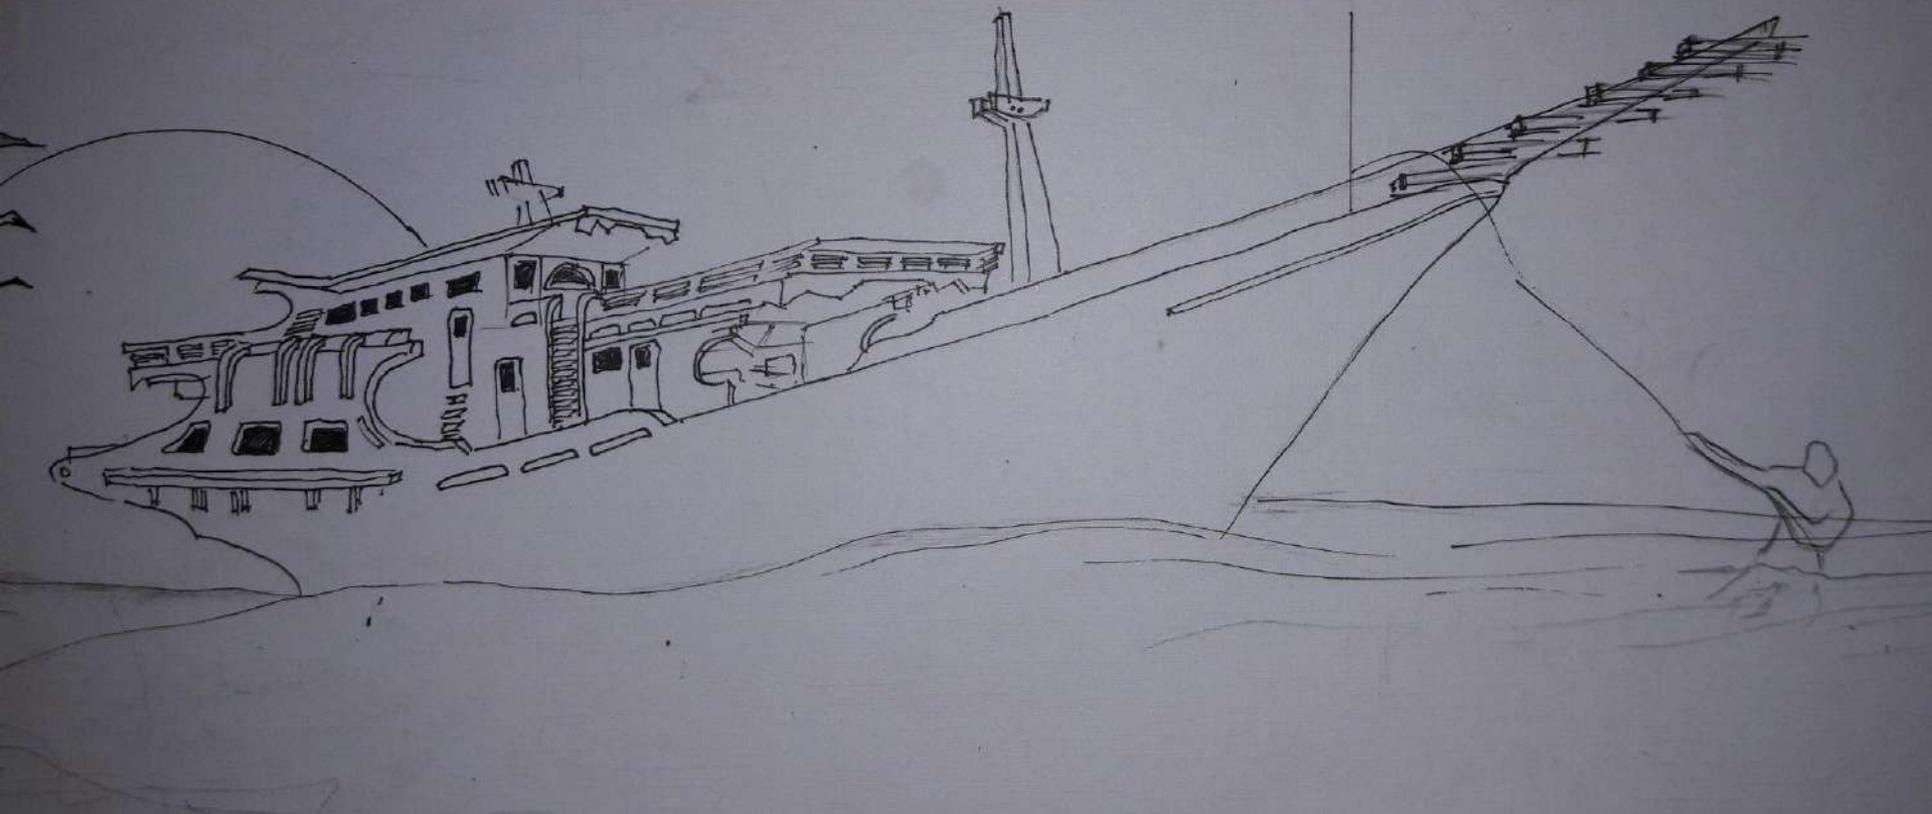

**And yet there is always  
more to discover and learn**

As long as you take the time.

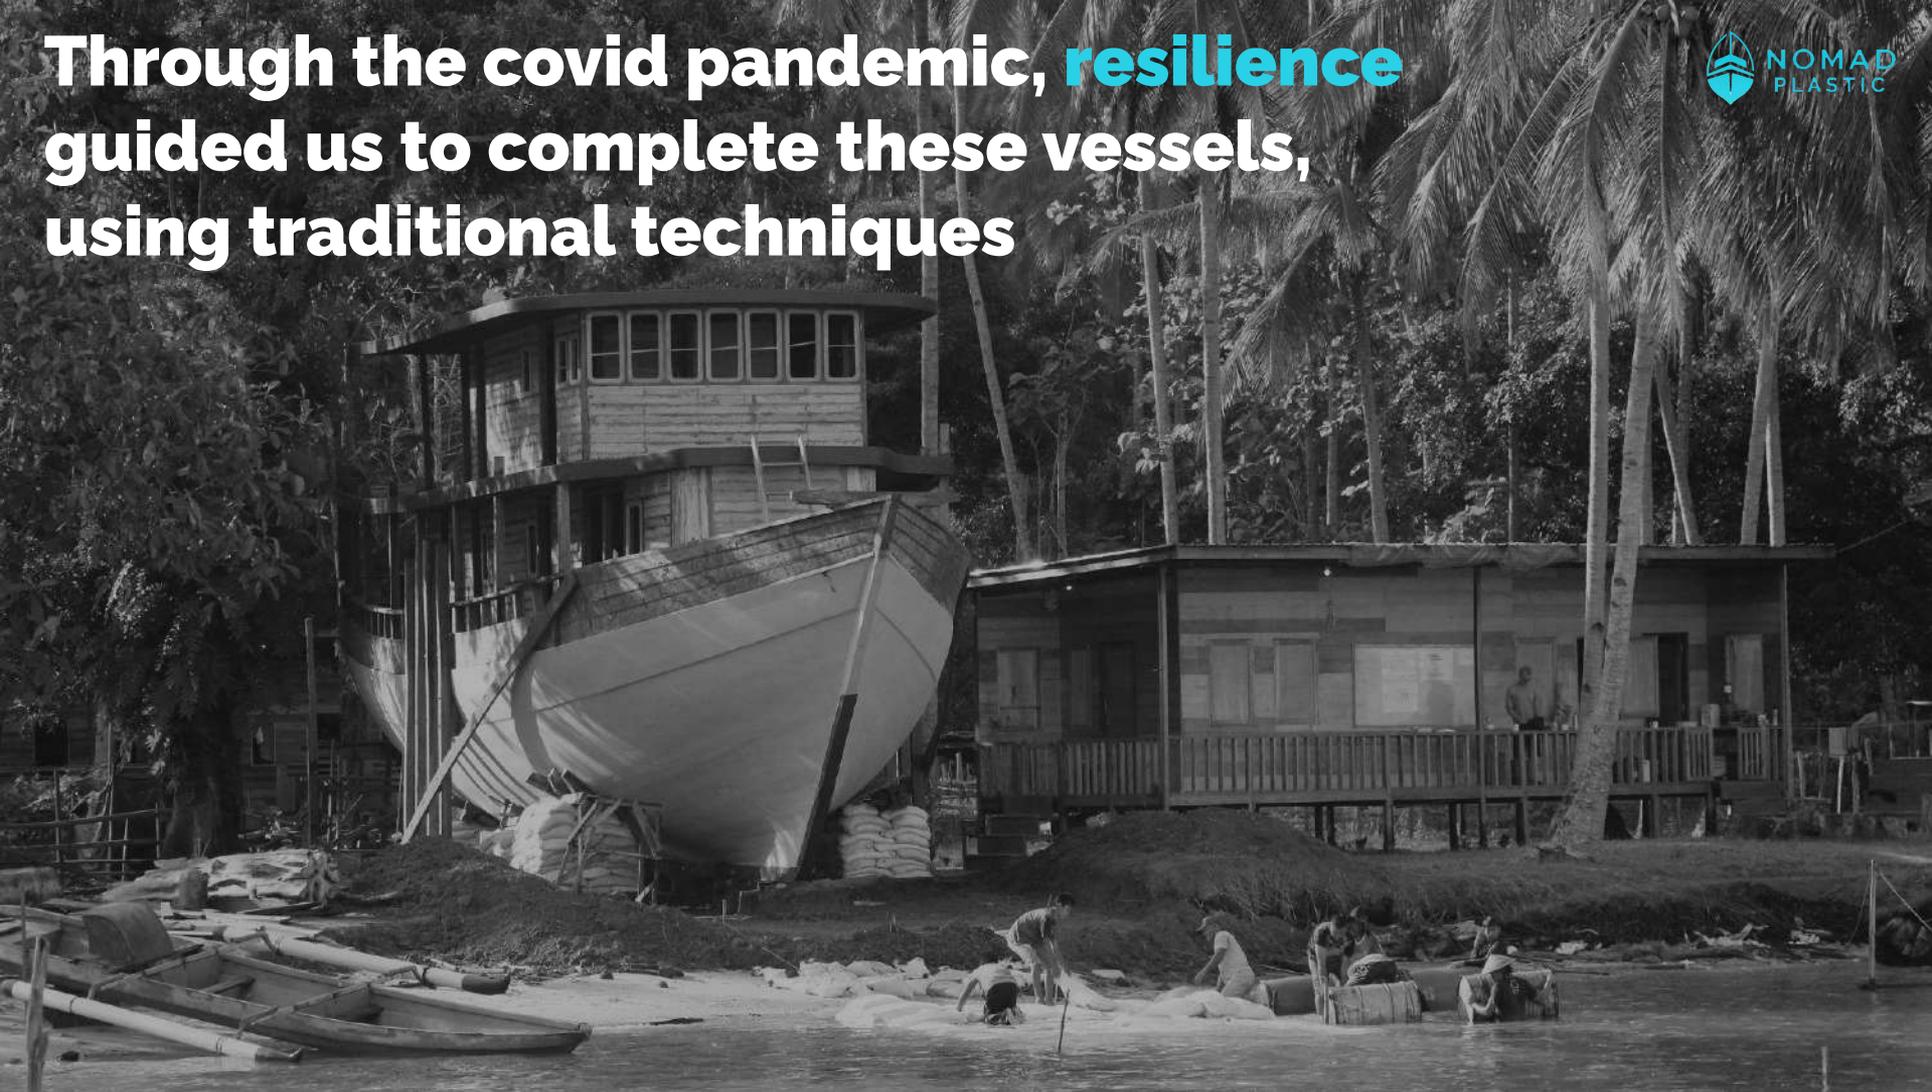

Sharing the same dream to come  
back to the essence of **slow travel**

**We embarked on the construction  
of two ships to [follow this vision](#)**

Through the covid pandemic, **resilience** guided us to complete these vessels, using traditional techniques

**As well as simple technologies to  
lower our carbon footprint**

This is how **Nomad Archipelago** is born:  
unique cruises, sustainable by design.

Signature cruise  
with the **Sea Nomads**

A high-angle photograph looking down into a large, circular fish trap. The trap is constructed from a green mesh net supported by wooden poles. Instead of fish, the trap is filled with a massive amount of plastic and organic waste, including sticks, twigs, plastic bottles, pieces of styrofoam, and other debris. A man wearing a light blue t-shirt and a black cap with goggles on his forehead is sitting in the center of the trap, looking up at the camera. He is holding a small object in his hands. The overall scene is one of environmental degradation and pollution.

**But on this journey, we were struck by  
plastic pollution, and kept on  
exploring but this time with purpose.**

*A fish trap, looking more like a plastic trap, Indonesia*

Everywhere we go, we witness  
a **growing problem.**

Causing **ecosystems destruction**,  
affecting the rich biodiversity and  
human livelihoods that strongly  
depend on it.

NOMAD  
PLASTIC

**That's why we created  
Nomad Community**

A local NGO to engage with villages  
and train **local champions**

Building long-lasting bounds  
with nearly **10 villages** so far

# Integrating a **waste collection** **program** to save the Ocean

With communities taking progressively **leadership** on actions.

But what do we do with  
these **low-value plastics**?

**Sending waste to landfill is  
simply not enough.**

**Contrary to high-value plastics like  
PET bottles, all sachets, plastic  
bags, multilayers find no market**

**And even reverse logistics is costly and carbon-intensive, hence the need for local transformation and local markets**

**This is why we partnered up with Plastic  
Odyssey, fellow explorers and experts with  
solutions to transform plastics**

A worker wearing a white hard hat with "ZEHN" on it, safety glasses, and a white beard guard is smiling while operating a red hose connected to a piece of machinery. The machinery is part of a larger industrial facility with blue pipes and tanks. Another worker in a white hard hat and blue uniform is visible in the background.

**Waste-to-fuel** turned out to be the best alternative for low-value plastics in those remote coastal areas

*Geo Trash Management's facility in Lombok, Indonesia*

**Giving value to materials that had none, enabling an **incentive across the value chain** and a local economy.**

With **mobile and low-tech** solutions as well, to access the most remote coastal areas and islands.

Extra revenue for the entire ecosystem is generated through **plastic credits** for every kg of waste, with the support of corporates

This is how we created the **Nomad Energy** program  
in partnership with Geo Trash Management (**GTM**)

We can then **fuel cruises** to explore these beautiful areas while having the most positive impact

As well as give **access to energy**  
to coastal villages and islands to  
improve livelihoods and the economy

**Finally, we give back to nature by allocating profits, enabling marine biodiversity conservation**

In partnership with strategic partners like **Blue Finance**, co-managing Marine Protected Areas and **Topotika Foundation**

**Because no nature = no business  
= no livelihoods ...**

At the heart of our model: **unifying the ecosystem**, bringing collaborations between communities, businesses and conservationists.

# We started from **fragmented ecosystems** lacking interactions and threatened by plastic pollution

**Local  
Communities:**  
Engagement

*Impact from plastics on health  
and hygiene,*

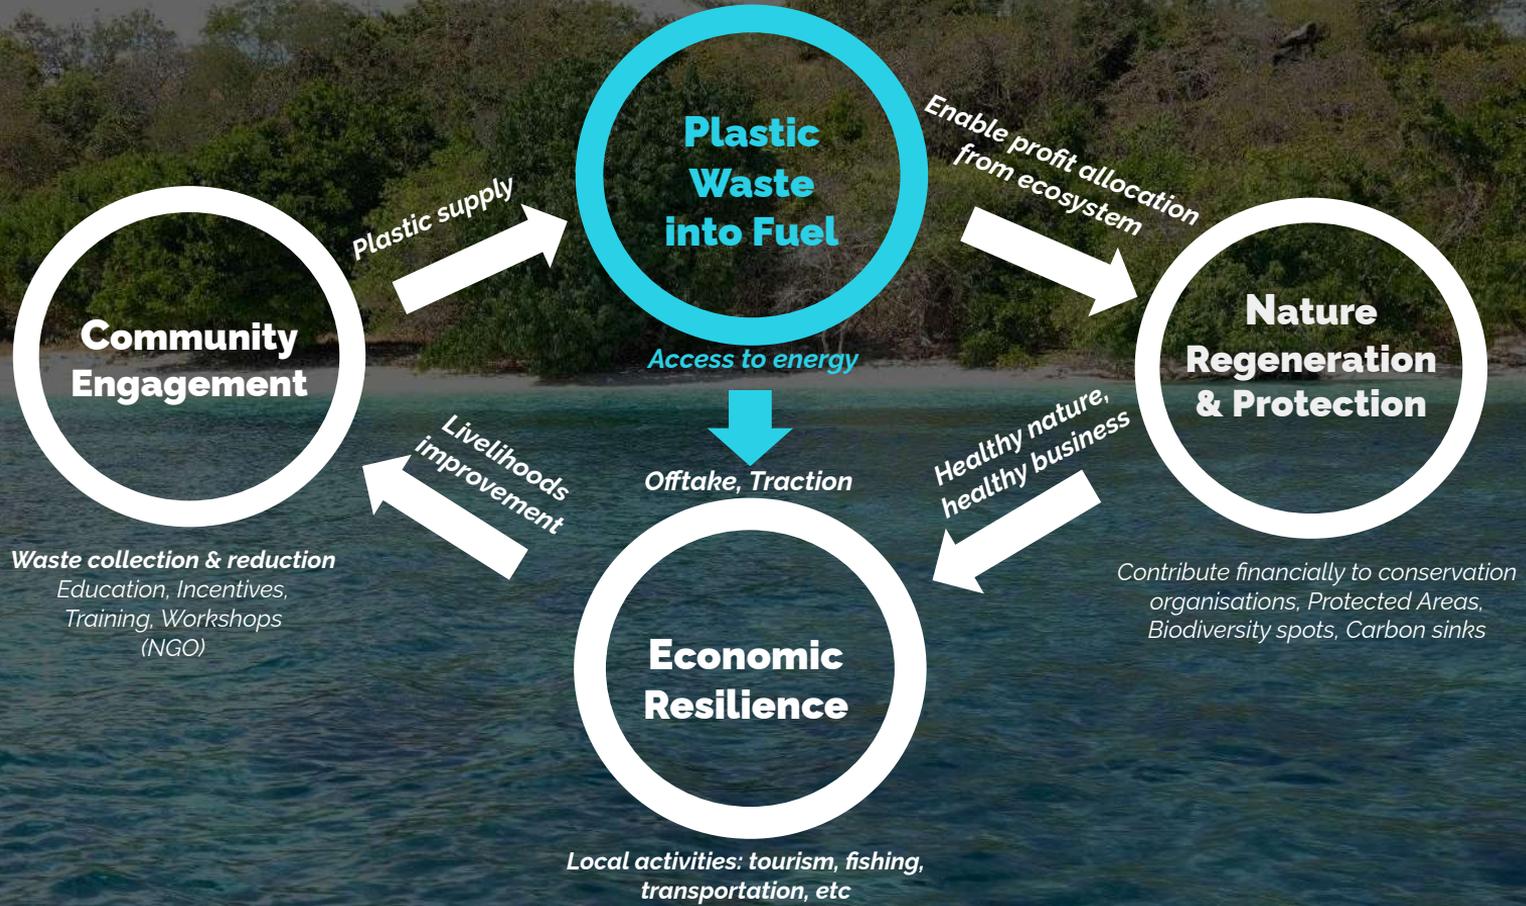

**Businesses:**  
Economic  
Resilience

*Plastic pollution threatening fishing  
activities as well as tourism*

**Nature  
& Biodiversity:**  
Protection &  
Regeneration

*Plastics suffocating marine ecosystems*

# And developed a model bringing circularity within ecosystems, **by leveraging plastic waste transformation.**

# We started building a pilot following this model to prove the concept: “Regenerative cruises” in Indonesia

Upon completion, we have a strong ambition to replicate and **end plastic pollution and regenerate nature** with clear targets for **2030:**

**+50 projects** in South-East Asia and Africa

Yearly capacity of **10,000 tonnes** of plastics recycled

Rehabilitation of **100,000 ha** of biodiversity hotspots

**Our outreach is already growing, with an increasing pipeline of projects across Asia and Africa**

**Now we need your help to complete our pilot and grow our impact!**

**Grants required**

**Loan required**

**Ready to go**

**Ready to go**

# WHERE WE ARE NOW

**Community engagement & waste collection**

**Plastic waste transformation into fuel**

**Fuel offtake for businesses & communities**

**Give back to nature: Protection & Regeneration**

**Here is how  
we can help:**

**Looking for donations  
or CSR support to grow  
our impact with our NGO  
Nomad Community**

**Looking for a USD 400,000  
concessional loan to build  
our first waste-to-fuel station  
in Indonesia with GTM**

**NOMAD
